

POSTDOCTORAL RESEARCH FELLOWS IN STRUCTURAL BIOLOGY

The Fesik lab is a multi-disciplinary group in the Department of Biochemistry at Vanderbilt University, dedicated to oncology drug discovery. We have an exciting opportunity for a talented and motivated structural biologist to join this dynamic group. This individual will work closely with cell biologists and chemists and will clone, express and purify recombinant proteins, carry out fragment-based screen by NMR, co-crystallize target proteins with small-molecule inhibitors, interpret Structure Activity Relationships (SAR), and contribute to the discovery of new targets for cancer drug discovery.

If interested, please provide a cover letter addressed to Dr. Fesik describing your relevant experience, a curriculum vitae, and a short research summary of your work and email to jason.phan@vanderbilt.edu
