SATURDAY, JULY 25

WK.02 Serial Crystallography Data Analysis with Cheetah and CrystFEL: Concepts and Tutorials

Organizers: Nadia Zatsepin, Edward Snell, Thomas Grant, Cornelius Gati

Salon 3/4

Funding for this workshop provided, in part, by BIOXFEL, and SLAC National Accelerator Laboratory

Serial femtosecond crystallography has yielded several major and unique advances in structural biology previously unattainable with conventional technologies, including the potential for sub-picosecond time-resolved crystallographic studies, probing cyclic or even non-cyclic reactions. With the construction of more than a dozen new XFELs currently under way, and the multiple recent demonstrations of SFX at synchrotrons, the potential user base is growing significantly. The development and appropriate use of new software to tackle the unique problems of SFX data analysis is vital to making SFX practicable.

The workshop will start with an introductory seminar, followed by most of the day dedicated to detailed hands-on tutorials with data sets collected at LCLS using the software suites Cheetah and CrystFEL, two of the most commonly used packages for SFX analysis. The concepts unique to SFX that we will be discussing are software independent.

WK.03 Rietveld Refinement Analysis

Organizers: Clarina Dela Cruz, Oliver Gourdon

Salon 5/6

This all-day workshop will introduce to the attendees the use to the Rietveld analysis technique. We will first emphasize the powder diffraction technique as well as the law and rules associated with it then move on to the Rietveld quantitative technique (solution and refinement of crystallographic data). Attendees will be asked to bring their own laptops with the software already downloaded. The workshop will be primarily targeted for novice users with limited experience in diffraction want to gain expertise in using the Rietveld analysis technique.

The Rietveld method is recognized as being at the forefront of the powder diffraction refinement technique. It is of extreme importance that more people are getting expertise into this technique to have a better understanding of their technological materials of interest.

**WK.04 Small Angle Scattering:
Structural Biology and Soft Matter**

Organizer: Richard Gillian
Philadelphia North and South

Funding for this workshop provided, in part, by Anton Paar, DECTRIS, XENOCs and Rigaku/Oxford Diffraction

Small angle x-ray solution scattering (SAXS) continues to experience dramatic growth within both the structural biology and soft matter communities. While there tends to be relatively little interaction between these communities historically, the two share essentially the same basic theoretical foundation as well as a number of tools and techniques. This workshop will bring together leading SAS experts in both areas to prepare students for successful experiments.

The morning portion of the dual-track/two-room workshop will be a joint session covering theory and practice common to both fields. After the joint session, the rooms will be divided and the two parallel sessions will cover specifics of the individual fields of soft matter and structural biology. In addition to synchrotron sources, this workshop is expected to have some content devoted to laboratory x-rays sources, but also particularly neutron sources and techniques. The workshop format will

include lectures, and a selection of hands-on practical exercises. Students will be expected to bring laptops with appropriate pre-installed software as necessary. Prior to the workshop, a website (prepared by Cornell) will be configured containing installation instructions and software for each tutorial. Throughout the workshop, the emphasis will be on knowing how to judge data quality, what to do about problematic samples, and basic requirements for acceptable publication of first-time data. Students will also learn tips and tricks for home laboratory data collection and be introduced to the various national synchrotron BioSAXS beamlines and neutron sources. This workshop will also aim to educate students about the particular advantages of neutron scattering and the extra steps necessary to carry out a first SANS experiment. Selected advanced modeling techniques will also be covered.

Saturday Evening Activities**First Time Attendee and
Student Meeting Orientation**

About the ACA

The American Crystallographic Association, Inc. (ACA) was founded in 1949 through a merger of the American Society for X-Ray and Electron Diffraction (ASXRED) and the Crystallographic Society of America (CSA). The objective of ACA is to promote interactions among scientists who study the structure of matter at atomic (or near atomic) resolution. These interactions will advance experimental and computational aspects of crystallography and diffraction. They will also promote the study of the arrangements of atoms and molecules in matter and the nature of the forces that both control and result from them.

Membership in ACA is open to any person who is actively interested in the purposes of the association and whose application is approved by the ACA Council or its designee. All members are entitled to voting privileges. Student members are very welcome and their contributions to the life and vigor of the association has always been important. The benefits of membership are the same in all categories. These include: voting privileges, Reflexions, the ACA newsletter that is published 4 times per year; complimentary subscription to the Newsletter of the International Union of Crystallography, and Physics Today, a monthly publication of AIP, and reduced rates for the International Tables for X-Ray Crystallography, Structure Reports, Journal of Applied Crystallography, and Acta Crystallographica when purchased for the member's personal use only. ACA is a member society of the American Institute of Physics (AIP) and an Affiliate Member of the International Union of Crystallography.

The total international membership of ACA is about 1,600 with meetings held annually. There are 12 Scien-

tific Interest Groups (SIGs) concerned with Biological Macromolecules, Fiber Diffraction, General Interest, Industrial, Light Sources, Materials Science, Neutron Scattering, Powder Diffraction, Service Crystallography, Small Angle Scattering, Small Molecules, and Young Scientists. A special division for members residing in Canada is also active. Members may join as many of these groups that are of interest to them. Each SIG is responsible for organizing sessions at Annual Meetings at least every other year.

The headquarters of the association is located at Hauptman Woodward Medical Research Institute, 700 Elicott St., Buffalo, NY 14203.
